Introduction

Samex Electronic is one of the largest electronics companies in Malaysia. The company is designed based on the business model and organisational structure of Samsung. Samex Electronics is involved in manufacturing, sales, and distribution of electronic products. This means the company produces electronic goods and also sells them to business customers.

The company was founded in 2010 by Mr Ahmad Salleh and Mr Chong Chin Xian. The head office is located in Kuala Lumpur, Malaysia. At the beginning, Samex Electronic started as a small electronics distributor. Due to strong demand and good management, the company slowly expanded its business and became one of the leading electronics suppliers in the country. Today, the company has branches in Penang, Selangor, Johor, and Sabah to support nationwide sales and delivery.

Samex Electronic mainly targets business customers such as distributors, retailers, and authorised dealers. These customers are usually business owners and managers aged between 25 to 55 years old, including both male and female. The company focuses on B2B (business-to-business) sales instead of selling directly to individual customers.

The company provides various products such as smartphones, televisions, washing machines, refrigerators, air conditioners, and other home appliances. All products are produced with high quality standards to ensure reliability and customer satisfaction. Besides physical products, Samex Electronic also offers after-sales service, technical support, warranty services, and product maintenance to ensure customers receive full support after purchase.

To support modern business operations, Samex Electronic operates through a corporate website and mobile application. These platforms allow customers to view product information, send enquiries, request quotations, and track their orders easily. The company also uses internal systems such as the Sales System to manage enquiries, orders, and deliveries efficiently.

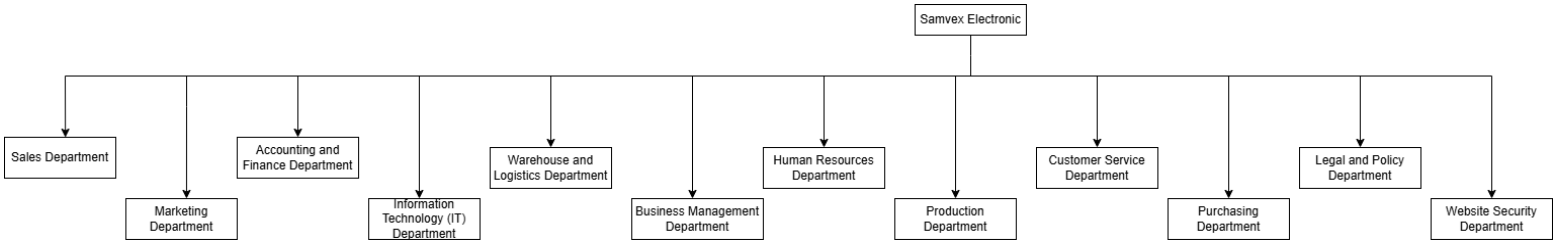

Samex Electronic aims to provide high-quality products, maintain good relationships with customers, and improve sales performance. With organised systems and strong management, the company continues to grow and remain competitive in the electronics industry.

Week 2: Case Study Organisation

Organisation Name: Samvex Electronic
Real Organisation Used for Reference: Samsung

Task 1: Design New Organisation Structure

1. Sales Department
2. Marketing Department
3. Accounting and Finance Department
4. Information Technology (IT) Department
5. Warehouse and Logistics Department
6. Business Management Department
7. Human Resources Department
8. Production Department
9. Customer Service Department
10. Purchasing Department
11. Legal and Policy Department
12. Website Security Department

Task 2: List Current Systems

System Used	Used Department
Sales System	Sales and Marketing Department
Inventory Availability System	Warehouse and Logistics Department
Sales Financial Management System	Accounting and Finance Department
Customer Relationship Management	Customer Service and Sales Department

Task 3: Describe System Functions

1. Enquiry and Quotation Function

Staff receive and record customer enquiries, then prepare and send out quotations. It is quick and professional.

2. Add to cart system

Customers can add products to a virtual cart, adjust quantities or remove items. The system automatically recalculates subtotals, taxes, and totals in real time, giving a clear summary before checkout for a smooth shopping experience.

3. Online Payment

The online payment system supports secure payment gateways such as credit cards, debit cards and e-wallets. Transactions are encrypted, processed instantly, and automatically logged with date, amount, and status for accurate records and customer trust.

4. Customer Service Support

Customers with problems can ask staff for help. Service staff can access customer profiles and order histories from the dashboard. This allows them to track orders and respond to enquiries quickly. The result is faster, smoother, and more helpful customer support.

Week 3: System Planning

Task 1: Describe Sources of Request

1. Top management
The Managing Director and Sales Director need better control over nationwide sales. Samex Electronic now has branches in Penang, Selangor, Johor, and Sabah. However, top management cannot see real-time sales data from all these branches at once. They have to wait for manual reports, which are slow and sometimes out of date.

Therefore, they request a new system that provides a central dashboard. This dashboard will allow them to monitor enquiries, quotations, and orders across all branches instantly. They want to be able to check daily sales results and customer enquiries directly on their screen without waiting for anyone to send a report. This will help them make faster decisions and increase productivity across the whole company.

2. Sales Staff
Sales executives handle many B2B customers, such as distributors, retailers, and authorised dealers. Every time a regular customer makes a new inquiry or asks for a repeat order, the sales staff must type the same customer information again and again. This wastes a lot of time and can lead to typing errors.

The sales staff request a system that can auto-fill customer details automatically. They also want the system to save quotation history, so when the same customer returns, they can quickly find past quotes and create repeat orders without starting from zero. This will allow them to serve more customers in less time.

3. IT Department
The IT team reports that the current Sales System cannot connect to the company website and mobile app. Customers submit enquiries online, but staff must manually key them into the system. The IT Manager requests a system with integration features to reduce manual work and errors.

Task 2: Improvements Requested

1. Quotation to Order Conversion

Currently, when a customer accepts a quotation, staff must manually create a new sales order from scratch. They have to re-enter customer details, product names, quantities, and prices. This process is slow and prone to mistakes, such as typing the wrong price or missing an item.

The sales staff request a system that can automatically convert approved quotations into sales orders. Once a customer agrees to a quote, staff can click one button to turn that quote into an order. All the data is carried over automatically, so nothing needs to be typed again. This will save time and reduce errors significantly

2. Online Order Tracking for Customers

Business customers often call or email the sales staff to check their order status. They want to know if the order is being processed, packed, shipped, or delivered. This creates extra work for the sales team, who must stop their other tasks to answer these questions.

Customers request access to view real-time order progress themselves through the company website or mobile app. They want to see delivery status and invoices online without having to call anyone. In addition, the system should automatically send an email or message to the customer after the product arrives and after order confirmation. This will give customers peace of mind and reduce the workload on the sales and customer service departments.

Week 4: System Planning - Feasibility Study

Task 1: Construct a Cost Summary Table

Table 1: Hardware Cost

Cost	Quantity	Unit price (RM)	Total price (RM)
PC (HP OmniDesk Desktop M02-0000t PC)	10	3000	30000
Server (Dell PowerEdge T150 Tower Server)	1	15000	15000
Network Infrastructure Set (Router, Switch, Cables)	1	5000	5000
Printer (Epson EcoTank L11050 Ink Tank Printer)	2	150	300
Monitor (ZOWIE XL2566K TN 360Hz DyAc+)	10	300	3000
Barcode Scanner (DS4600 Series 1D/2D Scanners)	450	10	4500
Uninterruptible Power Supply (APC Smart-UPS SMT1500C)	3	500	1500
Subtotal			593000

Table 2: Software Costs

Cost	Quantity	Unit Cost (RM)	Total cost (RM)
Operating System (Windows Server + 10 clients)	11 licenses	1200	13200
Database Management Software (MySQL)	1 licenses	8000	8000
Antivirus Software	11 licenses	200	2200
Cloud Backup Subscription (1 year)	1	1500	1500

Office software(Words, Excel, Powerpoint)	10 licenses	500	5000
Subtotal			29900

Table 3: Development Costs

Cost	Quantity	Unit price(RM)	Total price (RM)
Facilities Maintenance and Services (12 months)	12	1500	18000
Post-Development Warranty & Technical Support	-	25000	25000
Salary of System Analysis (4 months)	2	6500	52000
Salary of System Development (6 months)	4	5500	12300
Subtotal			107300

Table 4: Implementation Costs

Cost	Description	Quantity	Unit price(RM)	Total price(RM)
Worker training	Training user to improve skill,knowledge and performance	1	6000	6000
System Installation & Setup	Configure hardware and software to ensure a system operate correctly,securely,and smoothly	1	5000	5000
Data migration	Transferring data from old system to new system	1	10000	10000
User Manual & Documentation	Guide user and explain how the system administrators	1	3000	3000
Subtotal				24000

Summary Table

Major Components	Reference	Quantity	Total (RM)
Hardware Costs	Table 1	-	593000
Software Costs	Table 2	-	29900
Development Costs	Table 3	-	107300
Implementation Costs	Table 4	-	24000
Grand Total (RM)			754200

Task 2: Construct a Benefits Summary Table

Type	Benefit	Description
Tangible	Reduce staff cost Calculation (initial administrators cost -eliminated administrators 4,000,000 − 35pax × 12year × 1,800 = 4,000,000 − 756,000 = **3,244,000**	implementing an automated system can reduce tasks such as Quotation to Order Conversion. It can help reduce manual data entry time for sales staff
	Reduce Customer Service Call Cost 20 calls/day × 5 minutes/call ÷ 60 minutes/hour × RM20/hour × 22 days/month × 12 months/year = **RM8,817.60 per year**	Customer no need to call customer service to confirm the tracking status. It can let customer service handle more calls in a day.
Intangible	Improved Company Image	Using an automated system shows that the organization is modern and technology-driven, which increases customer confidence and strengthens market position.
	Improved data accuracy and reliability	The system automatically transfers information from approved quotations to sales orders, it eliminates manual re-entry of data. This reduces human errors such as incorrect pricing, wrong product quantity, or customer information mistakes. Accurate data improves overall system quality and decision-making.

Week 5: System Analysis- Fact Gathering

Task 1: Design Interview Questions

Describe ONE(1) System Function Problem

System Function: Add to cart system

The current Add to cart system is facing problems with manual type errors made by the Sales Department during data entry. When staff want to pick products for a dealer, they often select the wrong model or enter the wrong quantity for orders of Galaxy smartphones. It is because the system does not have a “double-confirmation” feature and staff does not notice. These wrongs will lead to checkout, causing the wrong amount of stock to be reserved and leading to incorrect billing for our customers.

Design Interview Questions

1. As a staff member who uses the system everyday, what features that you like to see on your screen to help you to avoid making typing mistakes when entering orders for dealers?

2. In your opinion, what should the staff of the Sales System Department do to make sure that every order is totally correct before it is saved?

3. What are the most important things that you check when you are analyzing a new order from a dealer and how does the current system help you do this?

4. What are your suggestions to make the system better so that we do not have order errors again?

5. In your experience, how long does it take you to fix an order error if a dealer complains about it, and how do you check the progress?

6. In your opinion, why do you think we sometimes pick the wrong Galaxy smartphone model from the product list?

7. How could a "Confirm" button help you catch a wrong model or quantity before the order goes to the warehouse?

Task 2: Design Questionnaires

Issues / Problem

1. Staff confusion with product models
   The current "Add to Cart" list is confusing because many Galaxy smartphone models looks similiar . Without a clear description or images, sometimes staff will pick the wrong model that leads to incorrect orders for our dealers.

2. Payment Gateway Timeout
   The Online Payment system will often disconnect before the transaction is done. This will cause a “timeout” error where the dealer’s money is deducted, but the system does not show the order as “Paid”. This will lead to double payments and manual refund work.

Questionnaires

Samvex Electronic System Questionnaires

In order to understand the member opinion and feedback on the electronic system, the Samvex Electronic management would like to ask all the members to complete the below questionnaire about the electronic system. Please return the questionnaire to the counter. Your response to the questionnaire is fully appreciated.

Name : _____ Email : _____(optional)

Phone Number : _____ No. ID : _____

1. When using the Add to Cart system, what specific details are missing from the product list that make it difficult to identify the correct Galaxy smartphone model?

2. When the Online Payment system disconnects, how do you communicate the status of the "Paid" order to the dealer to avoid confusion?

3. How would you suggest we change the checkout process to make it a more reliable and

error-free system for our dealers?

4. What are the key criteria or details that should be checked when confirming a bulk order to ensure the Add to Cart totals are correct?

5. Besides a "Confirm" button, what other safety checks or warnings should the system automatically perform before allowing a large or unusual order to be submitted?

6. What do you usually do first when you realize you added the wrong item to a cart?

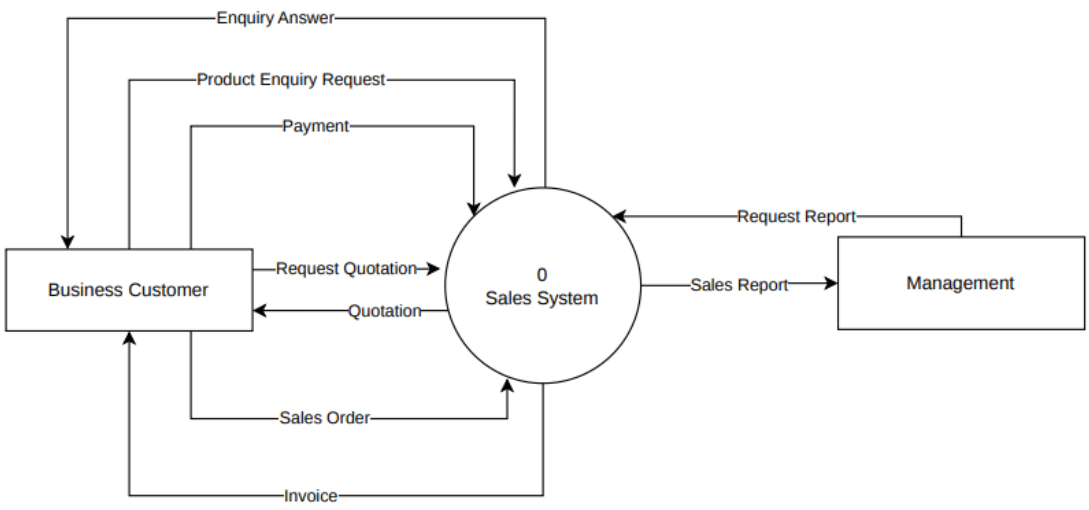

7. Did you find the "Add to Cart" and "Checkout" process clear and easy to follow?
[ ] Yes

8. Did you encounter any technical issues (like a Payment Gateway Timeout) during the approval process?

[ ] Yes	[ ] No

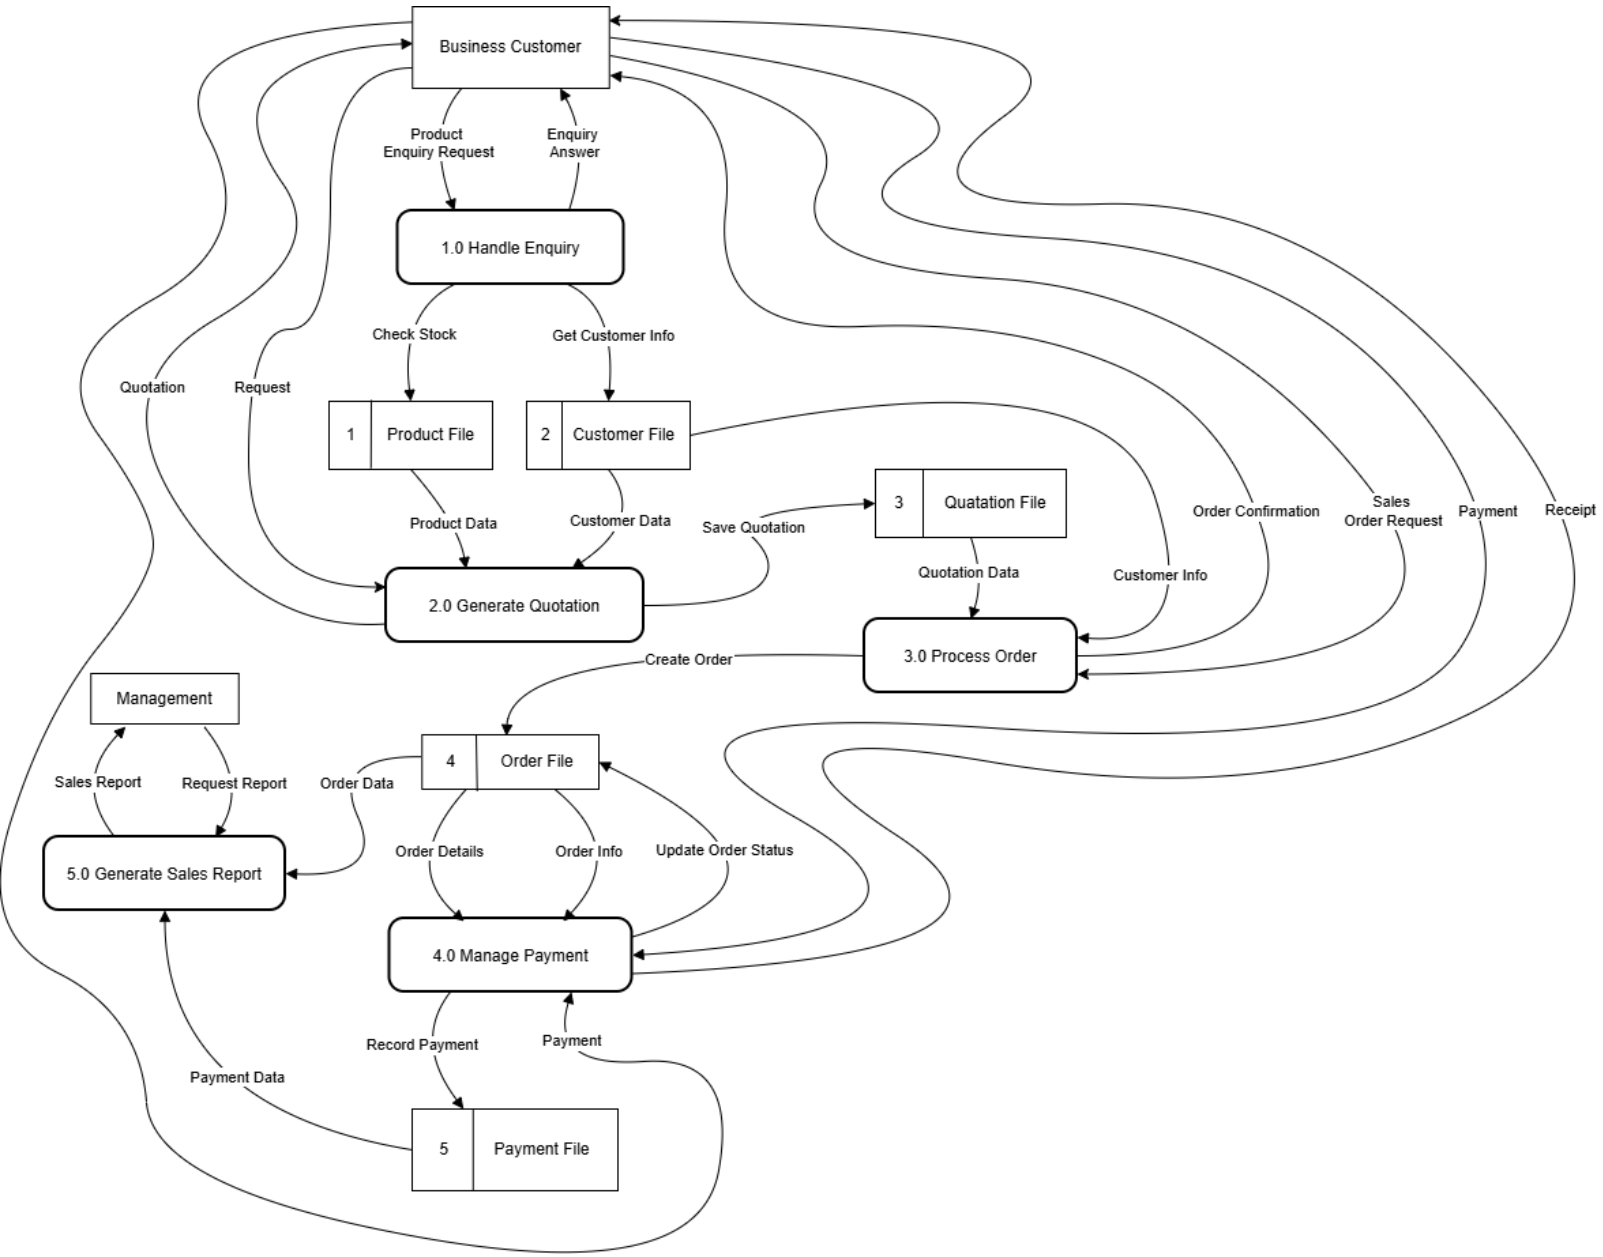

Week 6 : System Analysis - Fact Recording

Task 1 : Draw Context Diagram

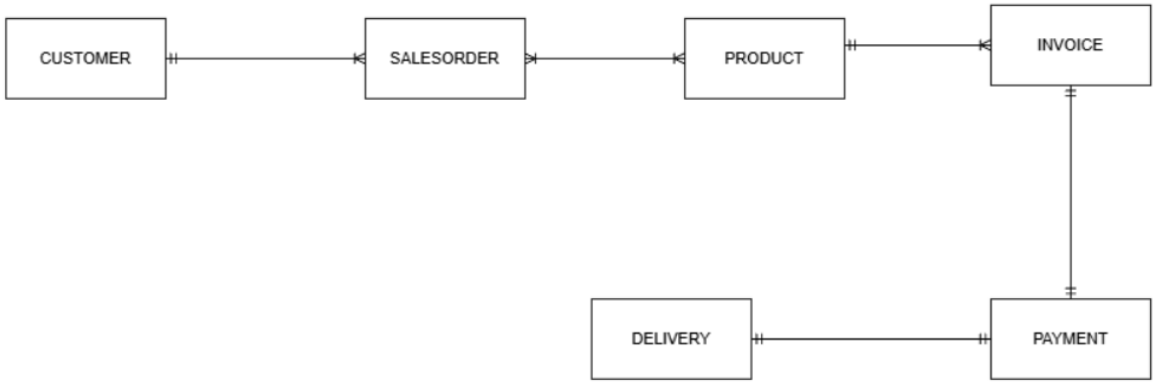

Week 7 : System Analysis - Fast Recording

Task 1 : Draw Diagram 0 DFD

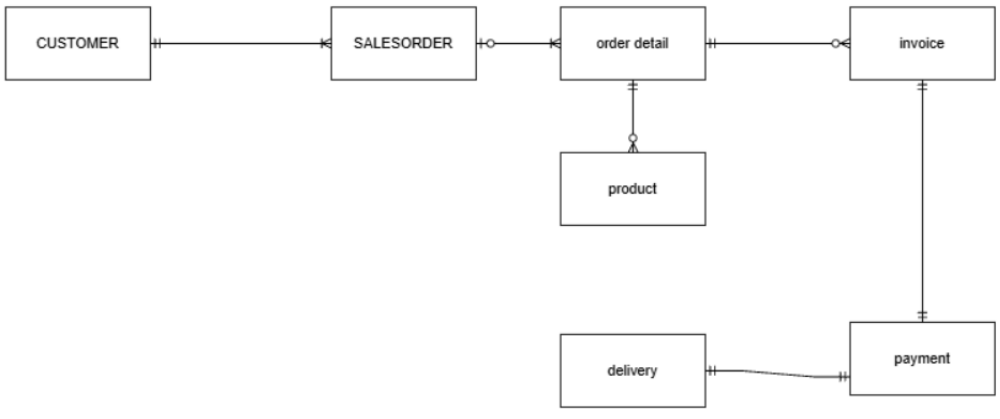

Week 8: System Analysis – Fact Recording

Task 1 : Draw ERD

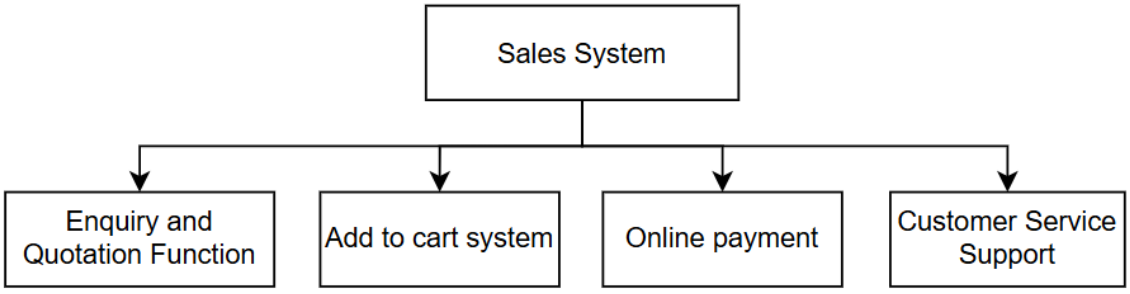

Task 2: Resolve any Many-to-Many Relationship

Week 9: System Design - Functional Design

Task 1: Draw Functional Structure Chart

Task 2: Describe Sub-system Functions

Sub-system functions:

1.Online Payment

- Manage Payment Transaction

  The Manage Payment Transaction part of the system is a safe way for customers to pay for their Galaxy smartphones. It allows buyers to type in their bank details into a secure screen. To make sure everything is safe, the Payment Verification function checks with the bank instantly to see if the card is real and if there is enough money. Once the bank says "Yes," the system saves a record into the D5 Payment File. If the internet cuts out, the system is smart enough to reset the screen so the customer doesn't get charged twice. Finally, the Notify Customer function sends a quick message to the buyer's phone or email to tell them, "We received your money!"

- Generate Payment Receipt

  Generate Payment Receipt creates a digital receipt immediately after payment so the customer has proof of their purchase. For users, this receipt serves as an official record and can be downloaded at any time through their secure business portal, which helps improve customer retention.

- Fee and Tax Calculation

  Fee and Tax Calculation automatically computes all additional charges before the customer pays. For users, this means they can see the final price including GST, service fees, or delivery charges upfront.

- Payment Cancellation

  Payment Cancellation gives customers the option to stop the payment process before it

is completed. Customers can go back and change their mind with add or delete products. This function clears any temporary session data, resets the payment screen, and ensures no transaction record is created unless the bank confirms approval. If the customer cancels midway, the system does not save anything to the Payment File.

2.Add to Cart System

- View Cart
  View Cart lets customers see all the items they have added so far. Customers can look at different Galaxy smartphone models, compare prices and features, and decide which one to buy. The function reads data from the Product File to display current price, stock availability, and specifications. Before showing the cart, the function also checks the Warehouse File to confirm the phone is actually in stock. If an item is out of stock, the system warns the customer immediately.

- Select Product
  Select Products allows customers to look at all the different Galaxy smartphone models available for sale. The system shows the price and what each phone can do so the customer can pick the right one. The system also looks at the Product Files to make sure the phone is actually in the warehouse before it lets the customer buy it. When a customer clicks a button, the phone is added to their shopping bag immediately.

- Manage Shopping Cart
  Manage Shopping Cart lets customers easily choose to buy more phones or fewer phones by typing in a new number. If the customer changes their mind, they can simply click "Delete" to take a phone out of their bag. The system automatically gives a cheaper price if the customer buys a lot of phones at once, so the staff do not have to calculate it by hand. When the customer is satisfied with their order, they click "Checkout" to send their final list to the Order Management Module to finish the sale.

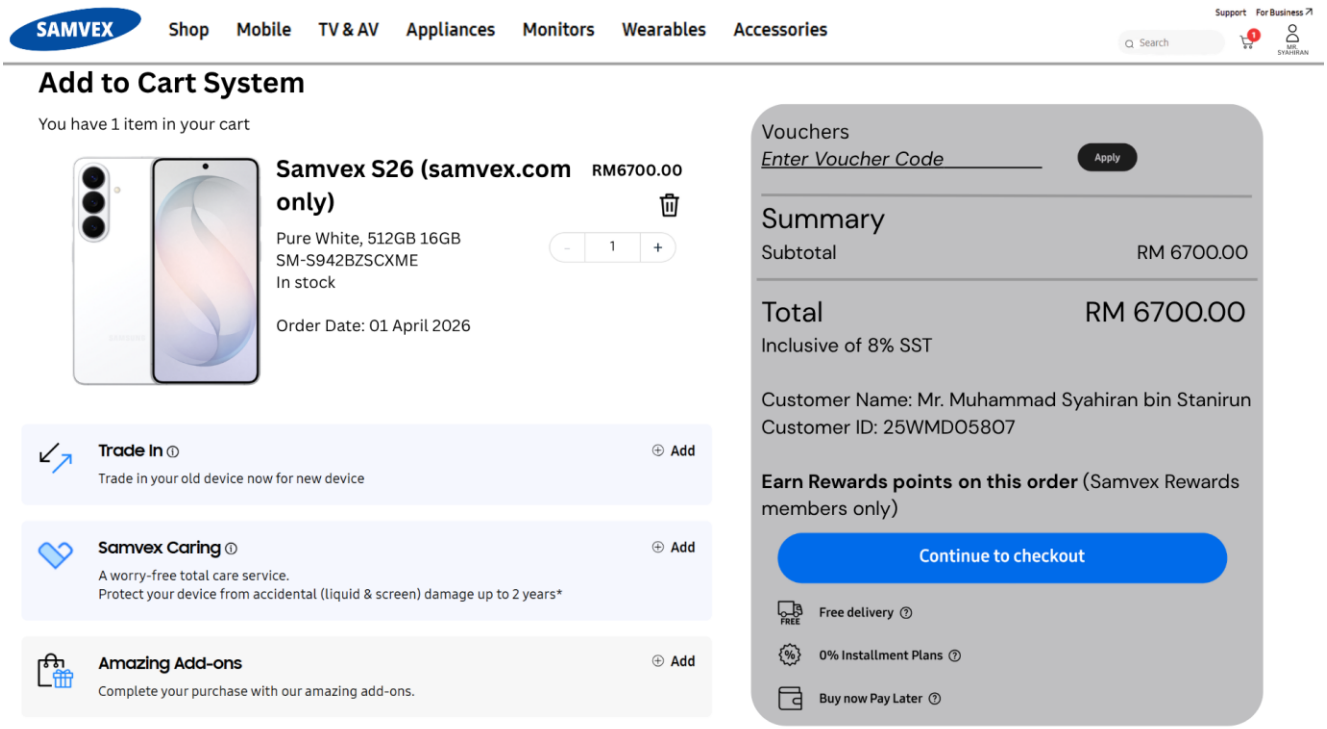

- Clear Cart

  Clear Cart allows customers to remove all items from their shopping bag with one click. Instead of deleting each item one by one, customers can click "Clear Cart" to empty everything at once. The system will ask "Are you sure?" to prevent accidental deletion. If the customer confirms, the system removes all items from the cart file and resets the total to zero.

Week 10: System Design – Inputs

Task 1 : Design Data Input Screen

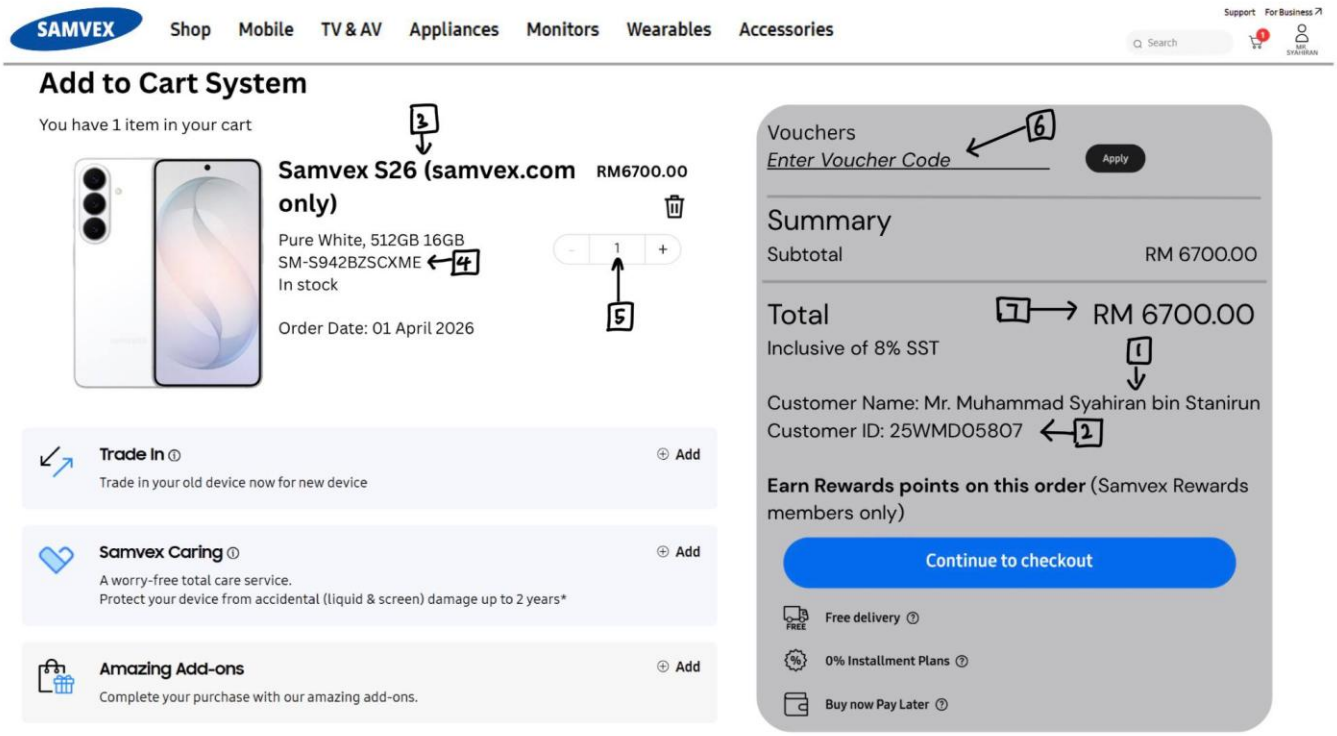

Add to cart module

Task 2: Identify Validation Check

A. Number ALL the Data Fields (on a copy of the above Input Screen)

No	Validation	Input Details
1	Customer Name	Muhammad Syahiran bin Stanirun
2	Customer ID	25WMDO5807
2	Model Name	Samvex S26
3	Product ID	SM-S942BZSCXME
4	Order Date	01 April 2026
5	Quantity	1
6	Voucher Code	SAVE2026S26
7	Total Amount	RM 6,700.00

B. Create Table Summary of Validation Checks

No	Field Name	Input Method	Validation Check	Explanation
1	Customer Name	System-filled	Null Value Check	To ensure the field is not left blank as a customer name is mandatory for creating an order.
2	Customer ID	System-filled	Existence/Presence Check	Verifies the ID exists in the Customer File to ensure the sale is linked to a valid account.
3	Model Name	System-filled	Data Type Check	To ensure the input contains alphabetic characters and follows the required naming convention.
4	Product ID	System-filled	Format Check	To verify the keyed-in ID exists in the relevant database to prevent adding non-existent products.
5	Order Date	System-filled	Format Check	To check that the date conforms to the expected DD/MM/YYYY format.
6	Quantity	Manual Click	Range Check	To ensure the number of units lies within the predetermined

				acceptable limits (e.g., 1 to 99).
7	Voucher Code	Manual typing	Size Check	To ensure the voucher code conforms to a certain number of characters (e.g., exactly 8 characters).
8	Total Amount	System-filled	Limit Check	To ensure the final transaction value is not below RM 0.00, confirming that the total is a valid positive number before checkout.

Task 3: Describe User-Friendliness Features

User- Friendliness Characteristic	Description
High Degree of Automation (System-Filled Fields)	The interface is designed to reduce manual data entry by using system-filled fields for information like Customer Name, Customer ID, and Product ID.
	By pulling this data automatically from the D1 Product File and D2 Customer File, the system saves the user time and prevents "typo" errors.
Clear Information Grouping & Visual Hierarchy	The screen is organized into logical blocks. The left side is dedicated to Product Details (item image, description, and quantity), while the right side is a distinct gray box for the Financial Summary and Checkout.
	This logical grouping allows the user to find information at a glance without being overwhelmed by a "wall of text." The blue "Continue to checkout" button is highly visible, guiding the user to the next step of the transaction.

Week 11: System Design – Data Definition

Task 1 : Make a Copy of ERD (Resolved)

Task 2 : Create Attributes.

CUSTOMER (**CustomerID**, Name, CustNo, Address, JoinedDate, Email, Gender)

BRANCH (**BranchID**, Location)

STAFF(**StaffID**, StaffName, StaffNo, Gender)

SALESORDER (**OrderNo**, TotalAmount, Date, CustID*, BranchID*)

PRODUCT (**ProductID**, Desc, UnitPrice, StockQuantity)

INVOICE (**InvoiceNo**, Name, CustNo, OrderNo*)

DELIVERY (**DeliveryID**, Address, DeliveryStatus, InvoiceNo*)

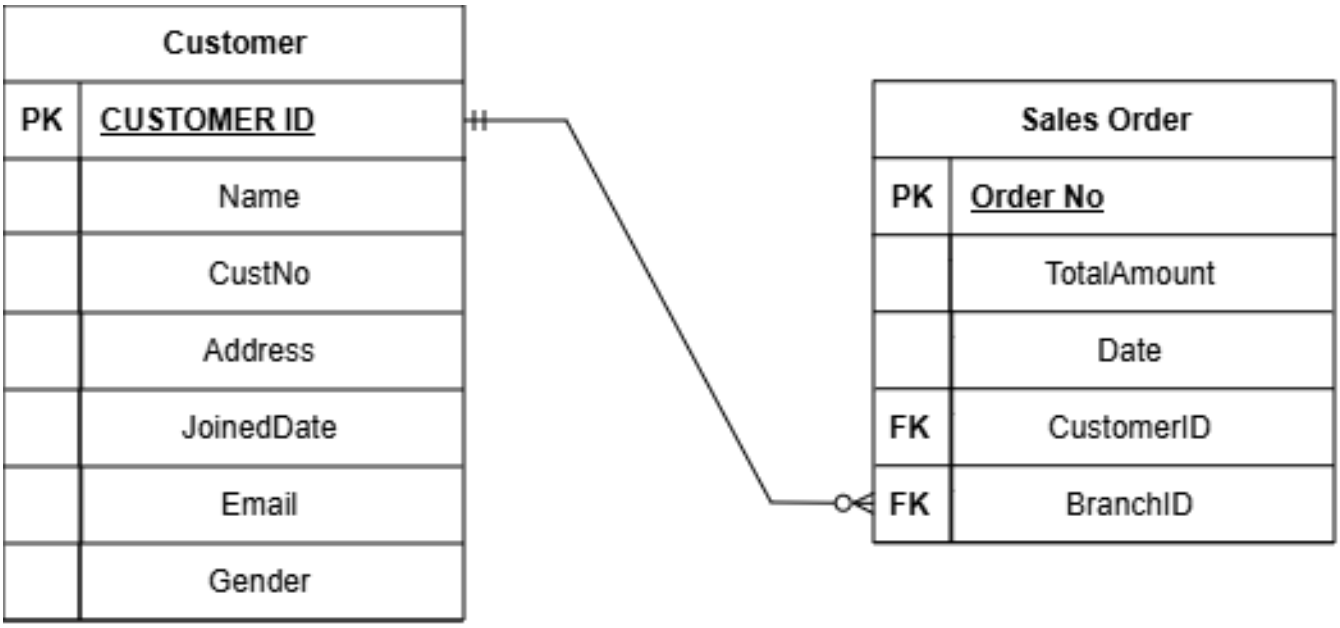

PAYMENT (**PaymentID**, OrderConfirmation, PaymentConfirmation, InvoiceNo*, PaymentMethod)

Week 12: System Design - Database

Task 1 : Select Entities and Draw an ERD

Entities Selected: Customer , OrderNo

ERD Diagram:

Task 2 : Design Code (Primary Key)

Table 1 : Customer
Primary Key : CustomerNo
Description: The CustomerNo is designed using a derivation code approach. It combines three components: a fixed prefix "CUST" to identify the entity as a customer record, an 8-digit date (YYYYMMDD) to indicate the customer's registration date, and a 3-digit sequential number (001-999) to uniquely identify each customer registered on the same day. This design allows easy reference, sorting by date, and prevents duplicate codes.

Example Code :

Code Design	CustomerNo
Example of Code	 TYPE OF ENTITY | DATE OF PURCHASE | CUSTOMER NUMBER CUSTOMER
Components of Code	Type of entity: Identifies the record belongs to a registered customer in the Samvex Electronic system Date of Purchase: Indicates the exact date the customer registered (YYYYMMDD format) Sequential number: A 3-digit number that resets daily, uniquely identifying the first customer registered on that date

Table 2 : Sales Order
Primary Key : Order_ID
Code Design : Derivation Codes
Description : This code is a combination of date (DDMMYY), a 3-digit sequence number, and customer initials. The date format is DDMMYY, sequence number runs from 001 to 999, and lastly the customer first initial and last initial. (Need one paragraph)

Code Design	Sales Order
Example of Code	250325001JW
Components of Code	Date (DDMMYY): 250325 = 25 March 2025 Sequence Number: 001 = First order of the day Customer Initials: SW = Skibidi Wong

Task 3: Data Records

Customer					
Name	CustNo	Address	JoinedDate	Email	Gender
Skibidi Wong	SW001	12 Jalan SS2, Petaling Jaya	01-01-2026	skibidi.wong@gmail.com	M
Lisa Tan	LT002	45 Jalan Ipoh, Kuala Lumpur	15-02-2026	lisa.tan@gmail.com	F
Ahmad Samad	AS003	78 Jalan Ampang, Kuala Lumpur	10-03-2026	ahmad.samad@gmail.com	M
Megan Fox	MC004	33 Jalan Cheras, Kuala Lumpur	20-04-2026	megan.fox@gmail.com	F
Kumar Raj	KR005	99 Jalan Klang, Selangor	05-05-2026	kumar.raj@gmail.com	M

Sales Order				
OrderNo	TotalAmount	Date	CustomerID	BranchID
SO1001	5,499.00	05-01-2026	SW001	BR-SLG-01
SO1002	3,299.00	16-02-2026	LT002	BR-KL-02
SO1003	1,299.00	20-03-2026	AS003	BR-PHG-03
SO1004	4,250.00	30-04-2026	MC004	BR-KL-04
SO1005	1,299.00	14-05-2026	KR005	BR-KL-05

Week 13: System Design – Outputs / Reports

Task 1: Design a Summary Report

Report Title	Report Content	Who use	Purpose/Decision
Customer Sales Report for Q1 2026	This report shows total sales amount (RM) and total quantity units purchased for each customer, grouped by customer category (Distributor, Retailer, Authorised Dealer). Data is sorted from highest to lowest sales amount. Includes subtotals by grand total for the month.	Sales Manager (Sales Department)	To identify top performing customers and focus retention efforts on high value accounts. Also to identify inactive customers who have not placed any orders in the current month, allowing the Sales Manager to assign sales staff to follow up and reactivate those accounts

REPORTING PERIOD :
Q1 - JAN - MAC 2026

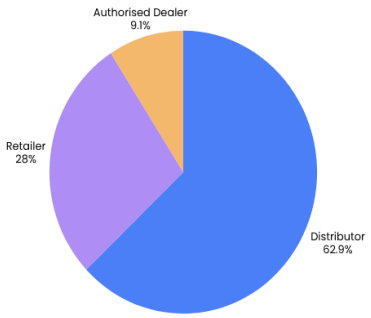

Branch: All Branches

SAMVEX ELECTRONIC

Customer Sales Report for Q1 2026

Customer ID	Customer Name	Customer Category	Total Quantity (Units)	Total Amount (RM)
CUST-PG-001	Senheng Electric	Distributor	45	301,500.00
CUST-JH-002	Thunder Match	Distributor	38	254,600.00
CUST-JH-001	Harvey Norman	Retailer	22	147,400.00
CUST-SB-003	IT World Sabah	Retailer	15	100,500.00
CUST-KL-004	DirectD Retail	Authorised Dealer	12	80,400.00
Grand Total			132	884,400.00

Sales Distribution by Category

Key Performance Indicators (KPIs)

- Average Order Value (AOV): RM 6,700.00
- Average Quantity per Customer: 26.4 Units
- Customer Retention Rate: 85%

Task 2: Design an Exception Report

Orders Pending Approval Over 48 Hours Report - April 2026

SAMVEX ELECTRONIC MALAYSIA

Sales Order Exception Report

Branch: All Branches (KL, Selangor, Penang, Johor, Sabah)

Reporting Period: 01 April 2026 – 30 April 2026

Sales Operations Manager(Sales Department)

Order No	Customer ID	Customer Name	Product ID	Order Date	Amount (RM)	Branch ID	Status	Reason for Delay
SO1001	SW001	Skibidi Wong	SM-S942BZSCXME	5/1/2026	5,499.00	BR-SLG-01	Pending	Payment Gateway Timeout
SO1002	LT002	Lisa Tan	SM-S942BZSCXME	16/2/2026	3,299.00	BR-KL-02	Cancelled	Credit Limit Exceeded
